Practical Example Modeling Bacterial Growth

Lets illustrate the practical application of calculus in biology A common model for bacterial growth is the exponential growth equation $\frac{dN}{dt} = rN$ Where N is the population size t is time r is the growth rate This differential equation states that the rate of change of the population $\frac{dN}{dt}$ is proportional to the current population size Solving this equation using techniques learned in calculus we get $N = N_0 e^{rt}$ Where N_0 is the initial population size This equation allows us to predict the bacterial population at any given time which is vital in many biological and medical applications
